Feedback on Initial Paper

ENG4701/FIT4701 S1 2026

Project ID: 2026S1-4701-john.grundy-C

Project Title: LLM/AI-aided software optimization

Student: Azab Azab

Student Email: aaza0010@student.monash.edu

Identifier Code: 7687938

Evaluation 1

Marker Email: abm.russel@monash.edu

Indicate the extent to which you agree that the following sections of the paper demonstrate excellent work

Section	Evaluation
Abstract	Somewhat agree
Introduction	Neither agree nor disagree
Project Background	Strongly agree
Methodology / Design Approach	Neither agree nor disagree
Results & Discussion	Neither agree nor disagree
Conclusion & Future Work	Somewhat agree
Referencing Quality	Somewhat agree
Presentation Quality	Strongly agree

Suggestions for Improvement (Eval 1)

Introduction could be improved. Clearly defined objectives and corresponding RQs of the project but methodology doesn't include energy measurement. Could justify why latency was measured. Could elaborate further on the quality and energy evaluation methods (for both inference and execution) along with any constraints.

Other Feedback (Eval 1)

Project Background	Strongly agree

Methodology / Design Approach	Strongly agree
Results & Discussion	Somewhat agree
Conclusion & Future Work	Somewhat agree
Referencing Quality	Somewhat agree
Presentation Quality	Strongly agree

Suggestions for Improvement (Eval 2)

This is a strong and well-scoped FYP paper. The topic is timely technically relevant and clearly motivated. The introduction and background are among the strongest parts of the paper. The aims objectives and research questions are clear and well aligned with the rest of the paper. The methodology is also strong. The experimental design is clearly staged. The use of six tasks across algorithmic data processing and API integration categories is appropriate and more realistic than relying only on short coding benchmarks. The initial results are useful and relatively convincing. However the results section could be improved by making the preliminary nature of the findings clearer. They should explicitly state which research questions are only partially addressed at this stage and which will be answered in ENG-FIT4702. IEEE formatting is mostly good but minor formatting consistency could be improved. The paper is well structured and has a clear research narrative. Minor improvements could include reducing repetition in the introduction ensuring terminology such as PET is defined before repeated use and clarifying the difference between inference energy execution energy token cost and monetary cost wherever they are discussed together.
